NP Completeness - II

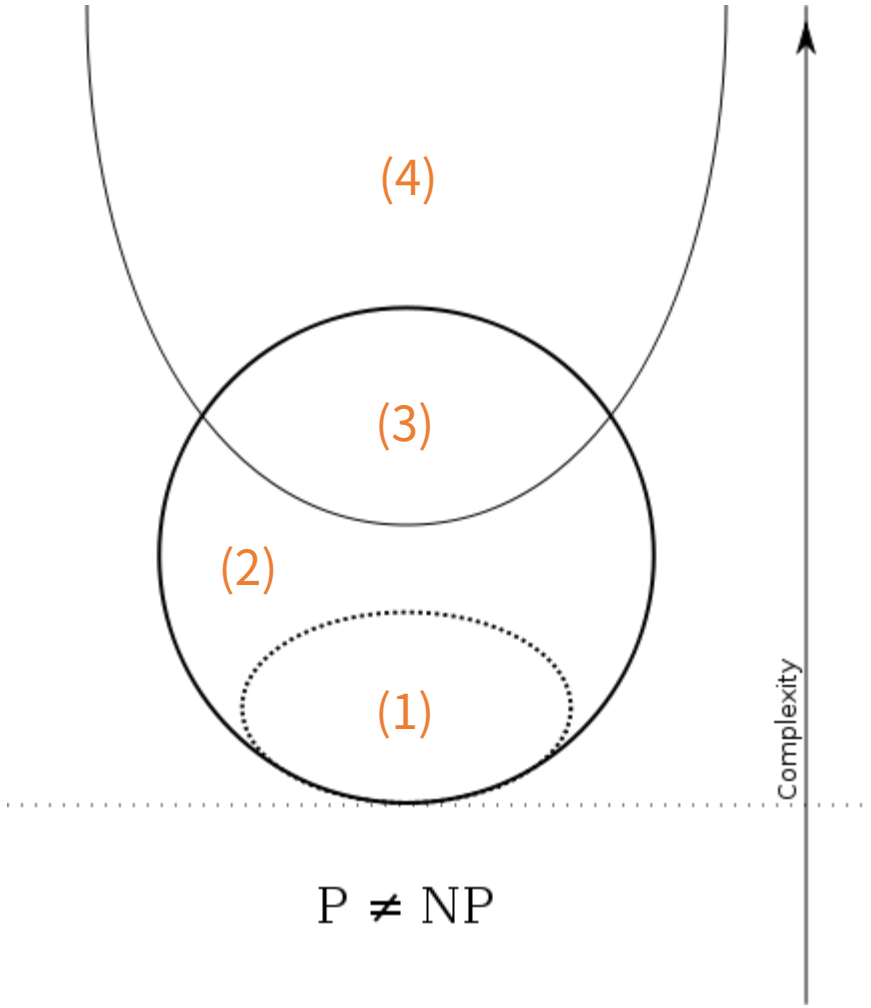
Hsu-Chun Hsiao

2-week Agenda

- NP-Completeness Overview
  - Warm up: graph coloring
  - Complexity classes
  - Decision problems
  - Reduction
  - Appendix: P-time solving vs. verification
- Proving NP-Completeness
  - Formula satisfiability
  - 3-CNF satisfiability
  - Clique
  - Vertex cover
  - Independent set
  - Traveling salesman
- Handling NP-completeness
  - Approximation algorithms: preview

Review

P, NP, NP-Hard, NP-Complete



Assume P≠NP for the following questions, unless specified otherwise.

True/False: If A can be reduced to B in polynomial time ($A \leq_p B$), then A is no harder than B

True/False: If $A \leq_p B$ and $B \leq_p C$, then $A \leq_p C$

True/False: NP-Complete problems can be reduced to each other in polynomial time.

True/False: If $A \leq_p B$ and B is in NPC, then A is in NPC too.

True/False: If $A \leq_p B$ and A is in NPC, then B is in NPC too.

Yes, Yes, Yes, No, No

True/False: If $A \leq_p B$ and B is in P, then A is in P too.
True/False: NPC problems can be solved efficiently if and only if P=NP.

Yes, Yes

Polynomial-time Solving & Polynomial-time Verification

Chap. 34.1, 34.2

Abstract problems

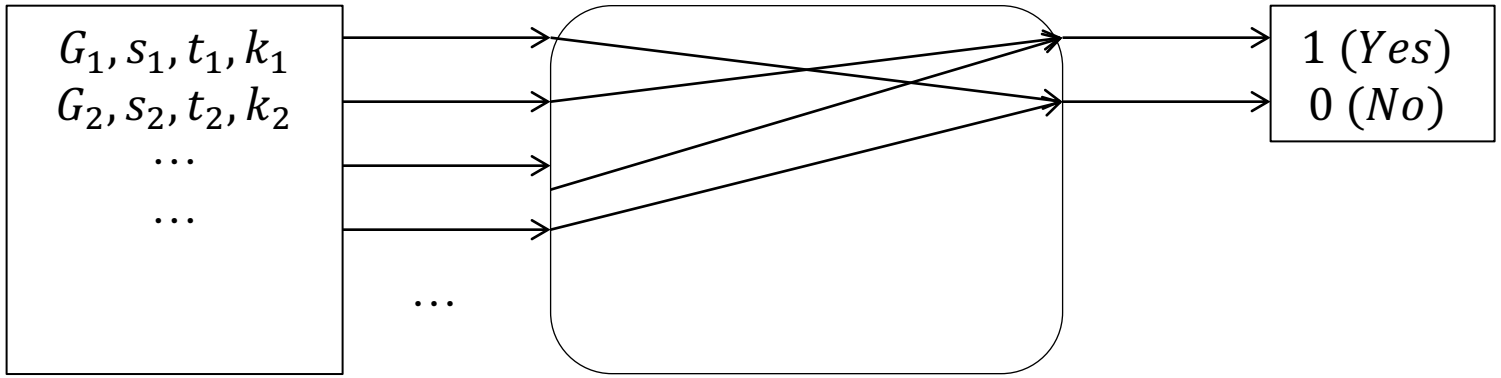
- I: the set of problem instances
- S: the set of problem solutions
- Q: an abstract problem, defined as a binary relation on I and S

Example of a decision problem, SHORTEST-PATH:

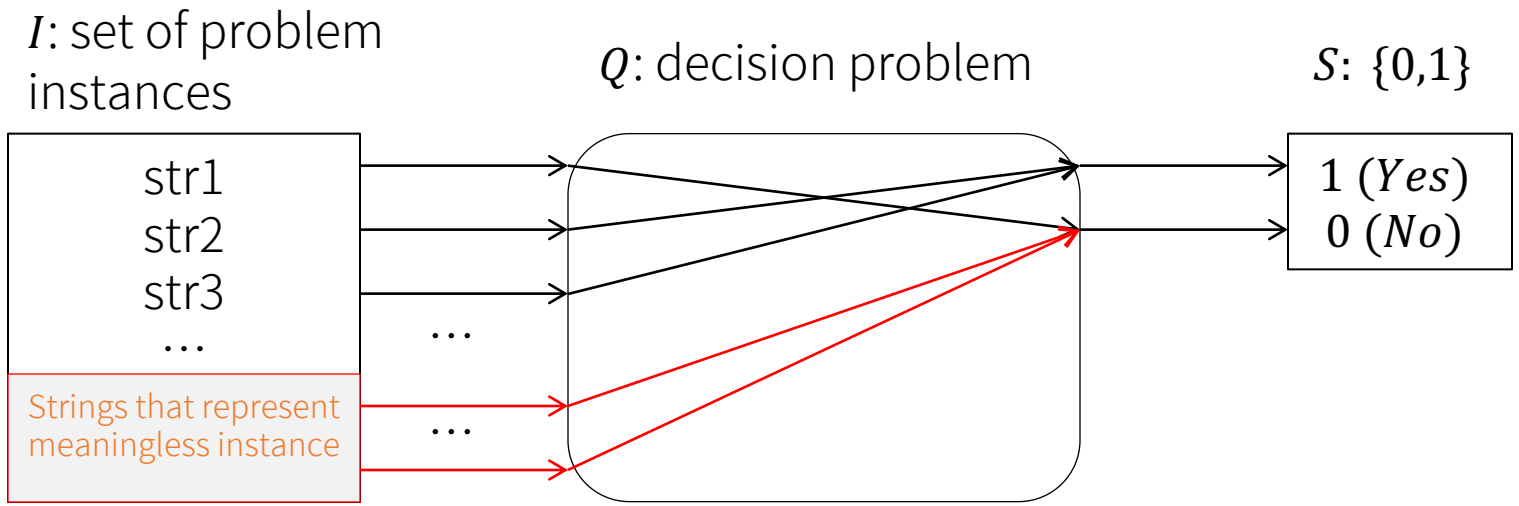
$I: < G, src, dest, k >$
所有可能的圖、起訖點、長度上限

Q: SHORTEST-PATH
是否找得到最短路徑長度 $\leq k$？

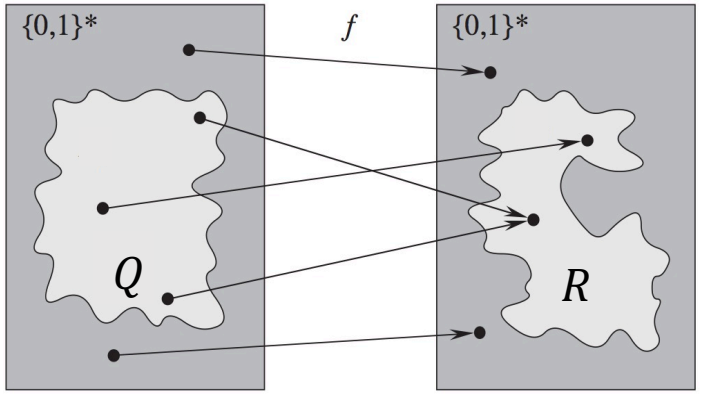
S: $\{0,1\}$



Representation of a decision problem

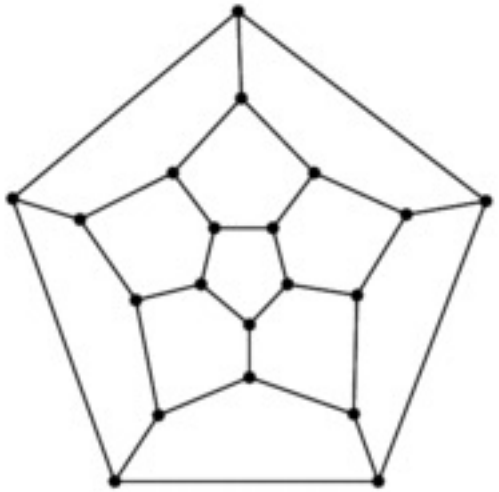


- I = the set of problem instances = Σ^*, where $\Sigma = \{0, 1\}$
- Q = a decision problem = $\{x \in \Sigma^*: Q(x) = 1\}$
  - 以答案為 1 的 instances 定義 decision problem Q
  - $Q = \{str2, str3\}$ in this simple example
  - Q can be reduced to R means $x \in Q \Leftrightarrow f(x) \in R$



Polynomial-time verification: Hamiltonian-cycle problem

- Suppose a nice TA gives you a certificate – a vertex sequence that forms a Hamiltonian cycle in a given graph G
- With this certificate, how much time does it take to verify that G indeed contains a Hamiltonian cycle?

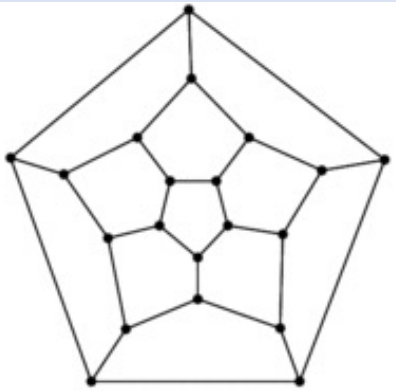


Verification algorithms

- Q = a decision problem $= \{x \in \Sigma^*: Q(x) = 1\}$
- Verification algorithm verifies an x is indeed in Q with the help of a certificate

HAM-CYCLE $= \{\langle G \rangle \mid G$ has a Hamiltonian cycle$\}$

Input x



Certificate y

Verification algorithm: Is y a Hamiltonian cycle in the graph (encoded in x)?

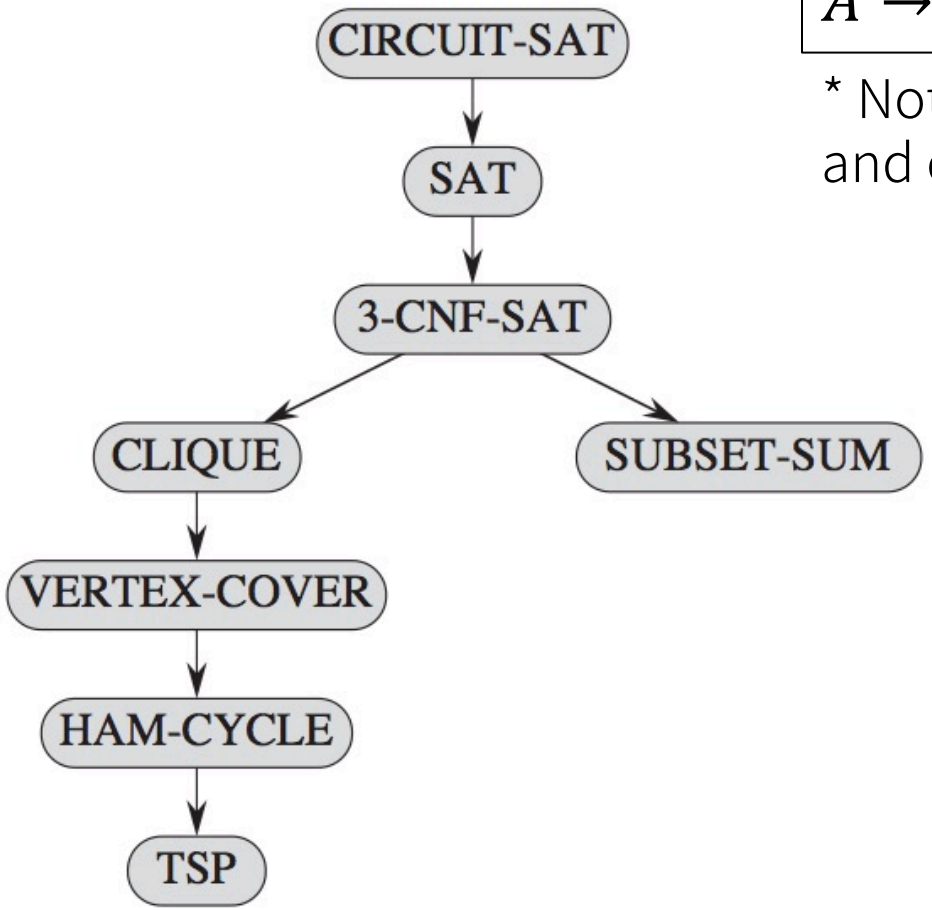
YES

(x is in HAM-CYCLE)

There exists a certificate for each YES instance

Classic NP-Complete Problems

Roadmap

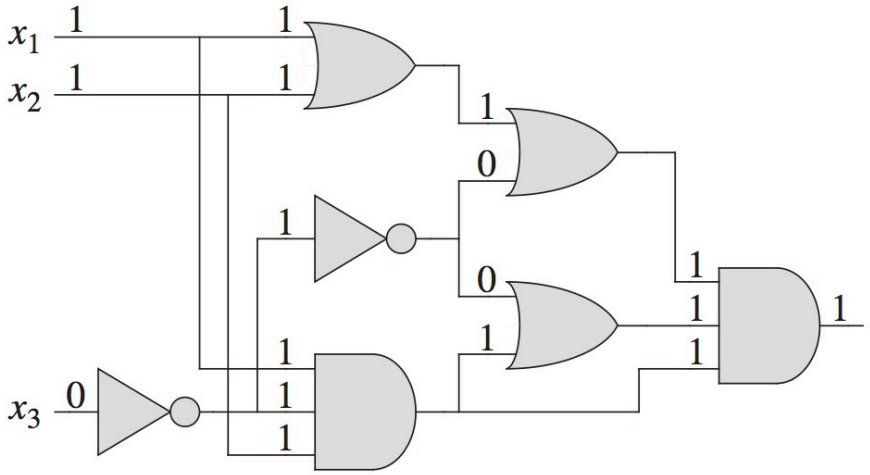


$A \rightarrow B$: we will demonstrate $A \leq_p B$

* Note that all of them are NPC problems, and can be reduced to each other in p-time

Circuit-Satisfiability Problem

CIRCUIT-SAT $= \{\langle C \rangle : C$ is a satisfiable Boolean combinational circuit$\}$



Cook's Theorem

The Circuit-Satisfiability Problem (CIRCUIT-SAT) is NP-complete

Formula satisfiability problem (SAT)

$\mathrm{SAT} = \{\phi | \phi$ is a Boolean Formula with a satisfying assignment $\}$

- Given a Boolean formula ϕ, is there a variable assignment satisfying ϕ?
  - $\wedge$ (AND), $\vee$ (OR), $\neg$ (NOT), $\rightarrow$ (implication), $\leftrightarrow$ (if and only if)
  - Satisfiable =ϕ is evaluated to 1
- Example: $\phi = \Big((x_1 \rightarrow x_2) \vee \neg\big((\neg x_1 \leftrightarrow x_3) \vee x_4\big)\Big) \wedge \neg x_2$
  - $\phi$is satisfiable, and <0, 0, 1, 1> is one solution

p	q	p^q	pvq	¬p	p→q	p↔q
T	T	T	T	F	T	T
T	F	F	T	F	F	F
F	T	F	T	T	T	F
F	F	F	F	T	T	T

Formula satisfiability problem (SAT)

$\mathbf{SAT} = \{\phi | \phi$ is a Boolean Formula with a satisfying assignment $\}$

- Is $\mathbf{SAT} \in$ NP-Complete?
- To prove that $\mathbf{SAT}$ is NP-Complete, we show that

1. $\mathbf{SAT} \in$ NP
2. $\mathbf{SAT} \in$ NP-hard (CIRCUIT-SAT $\leq_p \mathbf{SAT}$)
   ① CIRCUIT-SAT is a known NPC problem
   ② Construct a reduction f transforming every instance of CIRCUIT-SAT to an instance of $\mathbf{SAT}$
   ③ Prove that $x \in$ CIRCUIT-SAT $\Leftrightarrow f(x) \in \mathbf{SAT}$
   ④ Prove that f is a polynomial time transformation

SAT ∈ NP

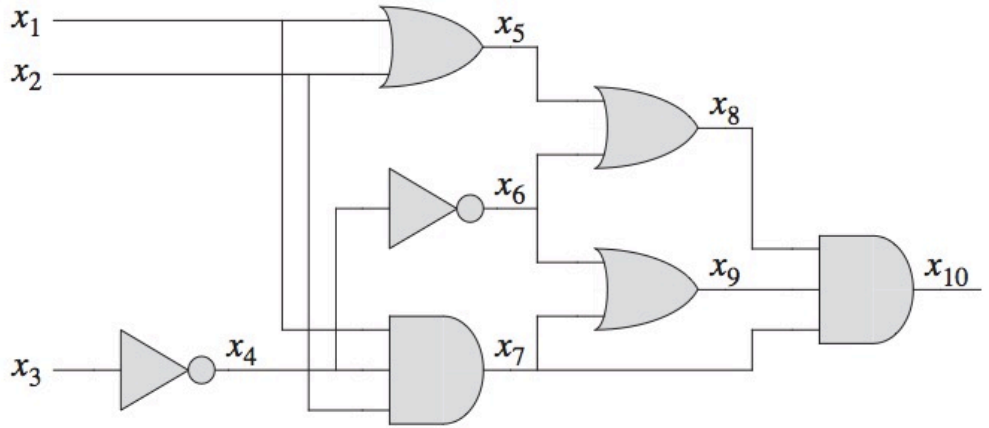
- Polynomial-time verification: replaces each variable in the formula with the corresponding value in the certificate and then evaluates the expression
- Example:
  - $\phi = \left((x_1 \rightarrow x_2) \vee \neg\left((\neg x_1 \leftrightarrow x_3) \vee x_4\right)\right) \wedge \neg x_2$
  - A certificate for Φ is <0, 0, 1, 1>

Textbook Ch.34-4: To show that SAT belongs to NP, we show that a certificate consisting of a satisfying assignment for an input formula ϕ can be verified in polynomial time. The verifying algorithm simply replaces each variable in the formula with its corresponding value and then evaluates the expression, much as we did in equation (34.2) above. This task is easy to do in polynomial time. If the expression evaluates to 1, then the algorithm has verified that the formula is satisfiable.

SAT ∈ NP-hard

① CIRCUIT-SAT is a known NPC problem
② Construct a reduction f transforming every instance of CIRCUIT-SAT to an instance of $\mathbf{SAT}$

Exercises 34.4-1 Consider a straightforward reduction that simply expresses the output using the input variables only. Describe a circuit of size n that, when converted to a formula by this method, yields a formula whose size is exponential in n.

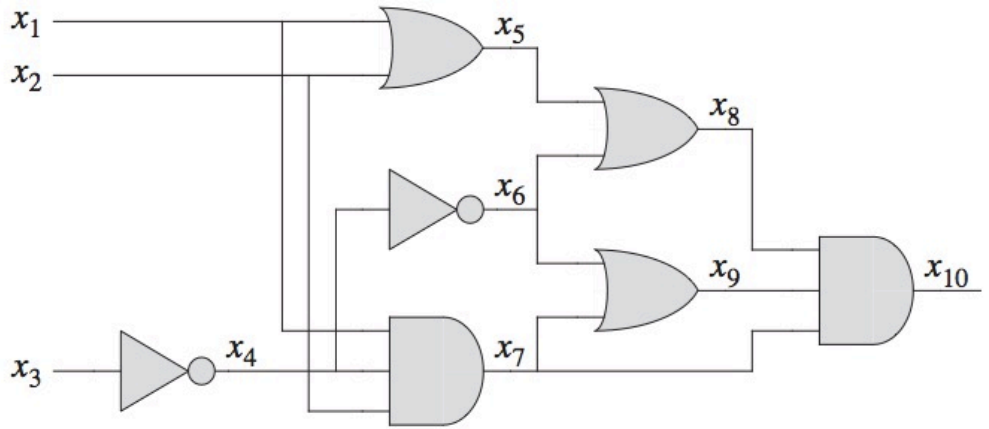


SAT ∈ NP-hard

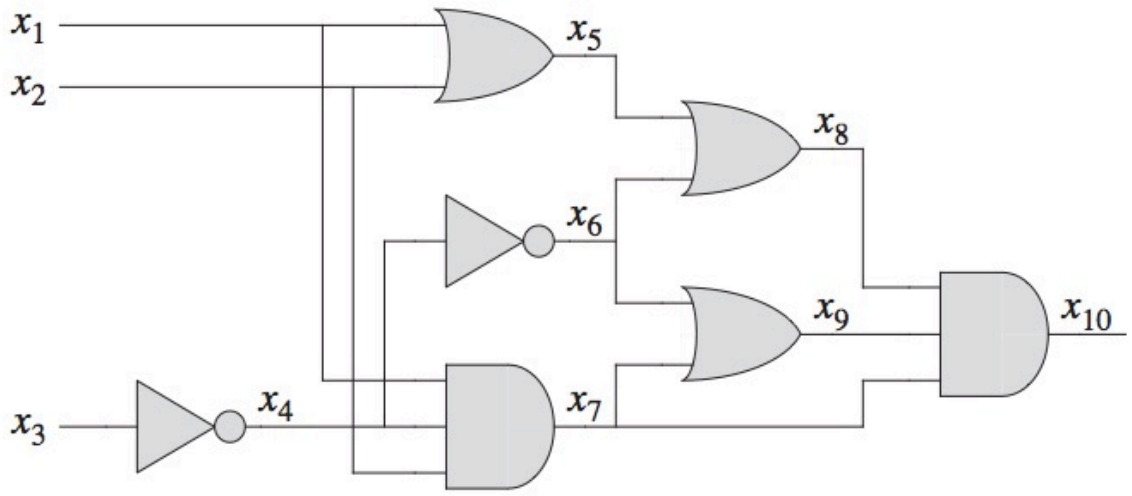
① CIRCUIT-SAT is a known NPC problem

② Construct a reduction f transforming every instance of CIRCUIT-SAT to an instance of $\mathbf{SAT}$

- Assign a variable to each wire in circuit C
- Represent the operation of each gate using a formula, e.g., $x_{10} \leftrightarrow x_7 \wedge x_8 \wedge x_9$
- ϕ = AND the output variable and the operations of all gates



SAT ∈ NP-hard

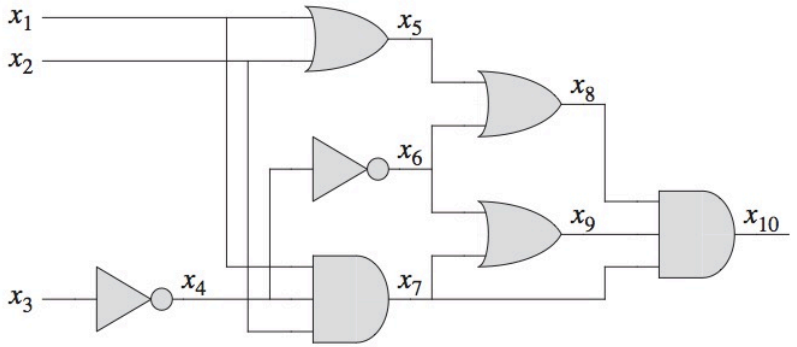


$$\begin{aligned}\phi = x_{10} &\wedge (x_4 \leftrightarrow \neg x_3) \\ &\wedge (x_5 \leftrightarrow (x_1 \vee x_2)) \\ &\wedge (x_6 \leftrightarrow \neg x_4) \\ &\wedge (x_7 \leftrightarrow (x_1 \wedge x_2 \wedge x_4)) \\ &\wedge (x_8 \leftrightarrow (x_5 \vee x_6)) \\ &\wedge (x_9 \leftrightarrow (x_6 \vee x_7)) \\ &\wedge (x_{10} \leftrightarrow (x_7 \wedge x_8 \wedge x_9))\end{aligned}$$

SAT ∈ NP-hard

③ Prove that $x \in$ CIRCUIT-SAT $\Leftrightarrow f(x) \in \mathbf{SAT}$
- $x \in$ CIRCUIT-SAT$\Rightarrow f(x) \in \mathbf{SAT}$
- $f(x) \in \mathbf{SAT} \Rightarrow x \in$ CIRCUIT-SAT

④ f is a polynomial time transformation



$$\begin{aligned}\phi = x_{10} &\wedge (x_4 \leftrightarrow \neg x_3) \\ &\wedge (x_5 \leftrightarrow (x_1 \vee x_2)) \\ &\wedge (x_6 \leftrightarrow \neg x_4) \\ &\wedge (x_7 \leftrightarrow (x_1 \wedge x_2 \wedge x_4)) \\ &\wedge (x_8 \leftrightarrow (x_5 \vee x_6)) \\ &\wedge (x_9 \leftrightarrow (x_6 \vee x_7)) \\ &\wedge (x_{10} \leftrightarrow (x_7 \wedge x_8 \wedge x_9))\end{aligned}$$

Satisfiability of Boolean formulas in 3-conjunctive normal form (3-CNF)

3-CNF-SAT= $\{\phi \mid \phi$ is a Boolean Formula in 3-conjunctive normal form (3-CNF) with a satisfying assignment $\}$

- Terms
  - Literal: 文字, a variable or its negation, e.g., x_1 or $\neg x_1$
  - Disjunctive : 析取, OR
  - Conjunctive: 合取, AND
  - Clause: 子句
  - Conjunctive normal form (CNF): 合取範式, conjunctive of disjunctive clauses
  - Disjunctive normal form (DNF): 析取範式, disjunctive of conjunctive clauses
  - 3-CNF: CNF where each clause has exactly 3 distinct literals
- Example: $\phi = (x_1 \vee \neg x_1 \vee \neg x_2) \wedge (x_3 \vee x_2 \vee x_4) \wedge (\neg x_1 \vee \neg x_3 \vee \neg x_4)$
  - $\phi$is satisfiable, and <0, 0, 1, 1> is one solution

Satisfiability of Boolean formulas in 3-conjunctive normal form (3-CNF)

3-CNF-SAT= $\{\phi \mid \phi$ is a Boolean Formula in 3-conjunctive normal form (3-CNF) with a satisfying assignment $\}$

- Is 3-CNF-SAT $\in$ NP-Complete?
- To prove 3-CNF-SAT is NP-Complete, we show that

1. 3-CNF-SAT $\in$ NP
2. 3-CNF-SAT $\in$ NP-hard ($\mathbf{SAT} \leq_p$3-CNF-SAT)
   ① $\mathbf{SAT}$ is a known NPC problem
   ② Construct a reduction f transforming every instance of $\mathbf{SAT}$ to an instance of 3-CNF-SAT
   ③ Prove that $x \in \mathbf{SAT} \Leftrightarrow f(x) \in$ 3-CNF-SAT
   ④ Prove that f is a polynomial time transformation

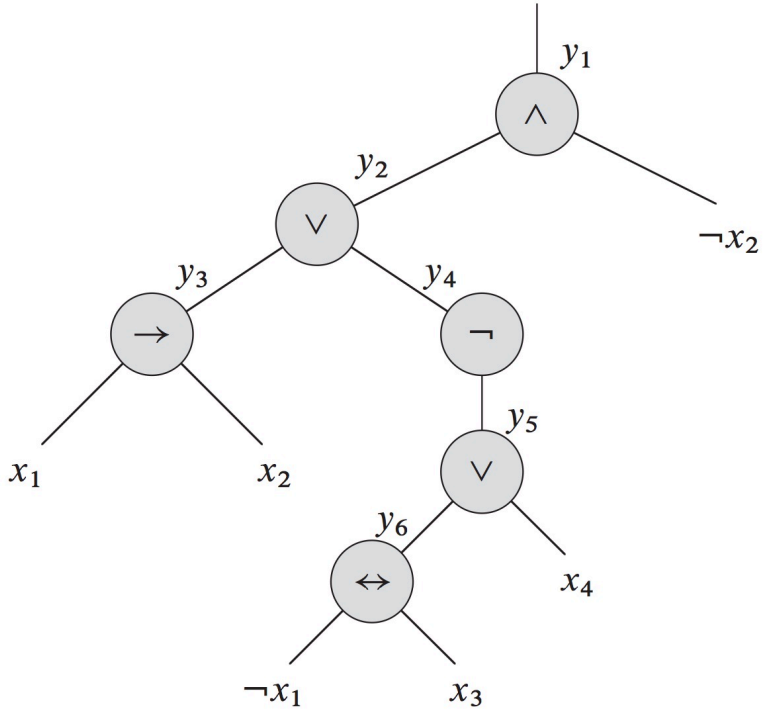
* We will focus on the construction of reduction functions from now on; but a full proof requires showing the other conditions are true as well

$\mathbf{SAT} \leq_p$ 3-CNF-SAT

② Construct a reduction f transforming every instance of $\mathbf{SAT}$ to an instance of 3-CNF-SAT

a) Construct a binary parser tree for input formula ϕ and introduce a variable y_i for the output of each internal node

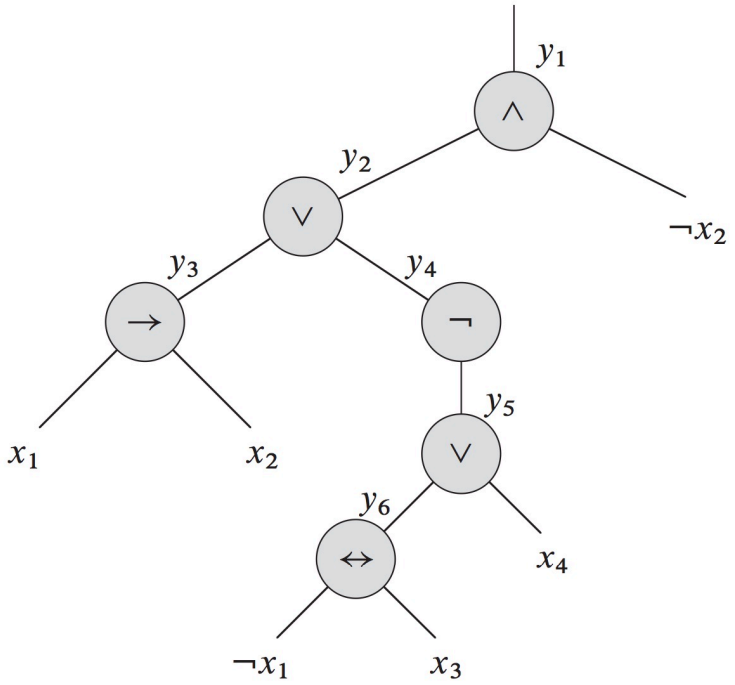
$$\phi = \Big((x_1 \to x_2) \vee \neg\big((\neg x_1 \leftrightarrow x_3) \vee x_4\big)\Big) \wedge \neg x_2$$



$\mathbf{SAT} \leq_p$ 3-CNF-SAT

② Construct a reduction f transforming every instance of $\mathbf{SAT}$ to an instance of 3-CNF-SAT

b) Construct ϕ' as the AND of the root variable and clauses describing the operation of each node



ϕ'_1

$$\begin{aligned}\phi' = {} & y_1 \wedge \boxed{(y_1 \leftrightarrow (y_2 \wedge \neg x_2))} \\ & \wedge (y_2 \leftrightarrow (y_3 \vee y_4)) \\ & \wedge (y_3 \leftrightarrow (x_1 \rightarrow x_2)) \\ & \wedge (y_4 \leftrightarrow \neg y_5) \\ & \wedge (y_5 \leftrightarrow (y_6 \vee x_4)) \\ & \wedge (y_6 \leftrightarrow (\neg x_1 \leftrightarrow x_3))\end{aligned}$$

$\mathbf{SAT} \leq_p$ 3-CNF-SAT

② Construct a reduction f transforming every instance of $\mathbf{SAT}$ to an instance of 3-CNF-SAT

c) Convert each clause ϕ_i' to CNF

- Construct a truth table for each clause ϕ_i'
- Construct the DNF formula for $\neg\phi_i'$
- Apply DeMorgan's Law to $\neg\phi_i'$ and get the CNF formula ϕ_i''

DeMorgan's Law		
$\neg(a \wedge b)$	$=$	$\neg a \vee \neg b$
$\neg(a \vee b)$	$=$	$\neg a \wedge \neg b$

			ϕ_1'	
y_1	y_2	x_2	$(y_1 \leftrightarrow (y_2 \wedge \neg x_2))$	$\neg\phi_1'$
1	1	1	0	1
1	1	0	1	0
1	0	1	0	1
1	0	0	0	1
0	1	1	1	0
0	1	0	0	1
0	0	1	1	0
0	0	0	1	0

$$\neg\phi_1' = (y_1 \wedge y_2 \wedge x_2) \vee (y_1 \wedge \neg y_2 \wedge x_2) \vee (y_1 \wedge \neg y_2 \wedge \neg x_2) \vee (\neg y_1 \wedge y_2 \wedge \neg x_2)$$

$$\phi_1'' = (\neg y_1 \vee \neg y_2 \vee \neg x_2) \wedge (\neg y_1 \vee y_2 \vee \neg x_2) \wedge (\neg y_1 \vee y_2 \vee x_2) \wedge (y_1 \vee \neg y_2 \vee x_2)$$

$\mathbf{SAT} \leq_p$ 3-CNF-SAT

② Construct a reduction f transforming every instance of $\mathbf{SAT}$ to an instance of 3-CNF-SAT

d) Construct ϕ''' s.t. each clause C_i has exactly 3 distinct literals

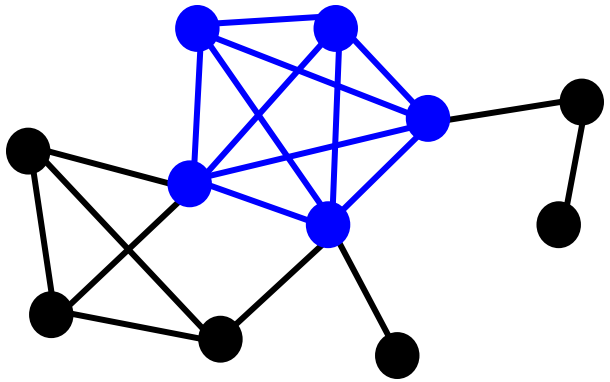
- C_i has 3 distinct literals: do nothing
- C_i has 2 distinct literals: $C_i = I_1 \vee I_2 = (I_1 \vee I_2 \vee p) \wedge (I_1 \vee I_2 \vee \neg p)$
- C_i has 1 literal: $C_i = I = (I \vee p \vee q) \wedge (I \vee \neg p \vee q) \wedge (I \vee p \vee \neg q) \wedge (I \vee \neg p \vee q)$

③ Prove that $x \in \mathbf{SAT} \Leftrightarrow f(x) \in$ 3-CNF-SAT

- Show that ϕ''' is satisfiable iff ϕ is satisfiable

The clique problem

- A clique in an undirected $G = (V, E)$ is a subset of $V' \subseteq V$ in which each pair of vertices are connected by an edge in E
- Optimization problem: find a clique of maximum size in G
- Decision problem: find a clique of size k in G



Does G contain a clique of size 4? YES

Does G contain a clique of size 5? YES

Does G contain a clique of size 6? NO

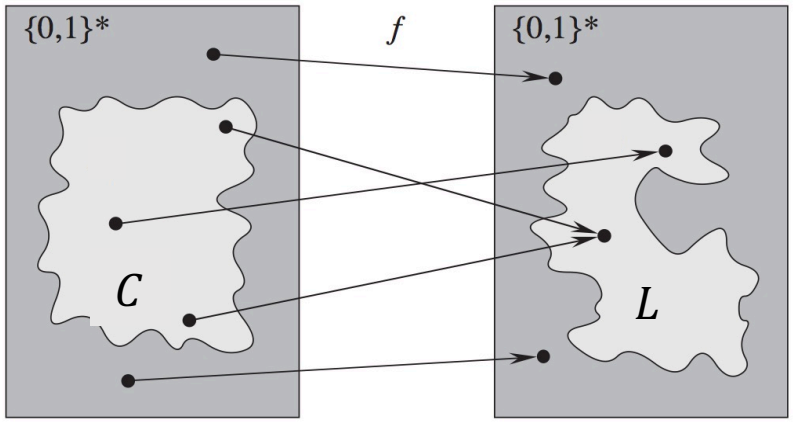
The Clique Problem

$\mathbf{CLIQUE} = \{\langle G, k\rangle : G \text{ is a graph containing a clique of size } k\}$

- Prove that $\mathbf{CLIQUE} \in$ NP-COMPLETE
- Polynomial-time reduction : 3-CNF-SAT $\leq_p \mathbf{CLIQUE}$

Step-by-step approach for proving L in NPC:

1. Prove $L \in$ NP
2. Prove $L \in$ NP-hard ($C \leq_p L$)
   ① Select a known NPC problem C
   ② Construct a reduction f transforming every instance of C to an instance of L
   ③ Prove that x in C if and only if $f(x)$ in L for all x in $\{0,1\}^*$
   ④ Prove that f is a polynomial time transformation



The Clique Problem

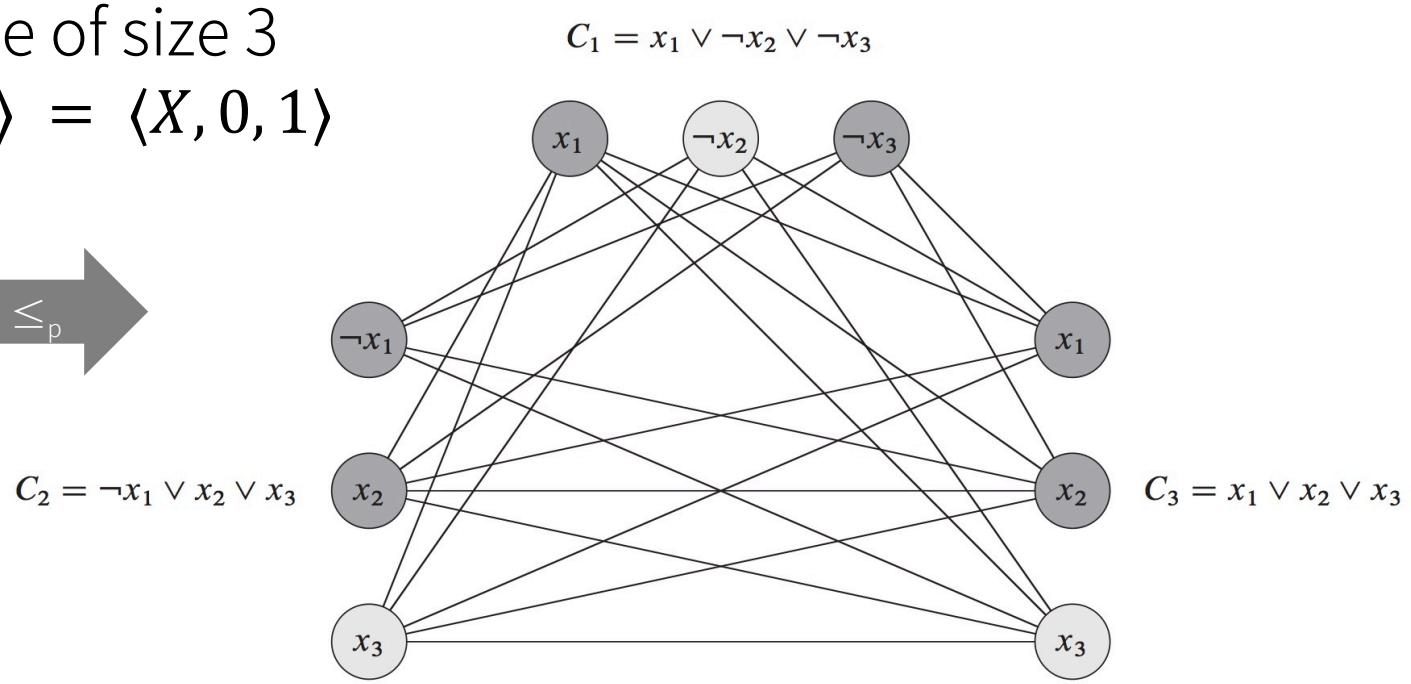
$\mathbf{CLIQUE} = \{\langle G, k\rangle\colon\ G \text{ is a graph containing a clique of size } k\}$

- Prove that $\mathbf{CLIQUE} \in$ NP-COMPLETE
- Polynomial-time reduction: 3-CNF-SAT $\leq_p \mathbf{CLIQUE}$
  - Construct a graph G s.t. ϕ with k clauses is satisfiable $\Leftrightarrow G = f(\phi)$ has a clique of size k

Example: $\phi = 1 \Leftrightarrow G$ has a clique of size 3
Satisfying assignment $\langle x_1, x_2, x_3\rangle = \langle X, 0, 1\rangle$

$$\phi = (x_1 \vee \neg x_2 \vee \neg x_3) \wedge (\neg x_1 \vee x_2 \vee x_3) \wedge (x_1 \vee x_2 \vee x_3)$$

$\leq_p$



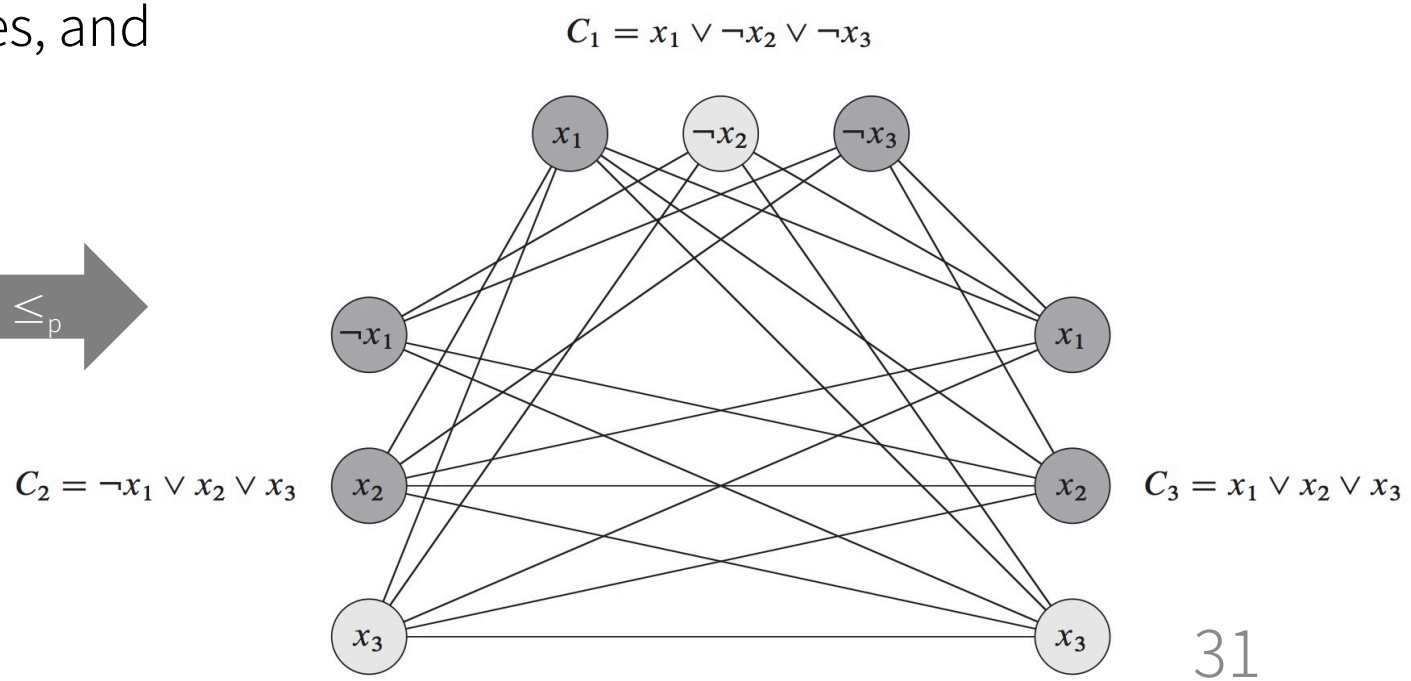
3-CNF-SAT $\leq_p$ CLIQUE

② Construct a reduction f transforming every instance of 3-CNF-SAT to an instance of CLIQUE

- Let $\phi = C_1 \wedge C_2 \wedge \cdots \wedge C_k$ be a Boolean formula in 3-CNF with k clauses, and each C_r has exactly 3 distinct literals l_1^r, l_2^r, l_3^r
- For each $C_r = (l_1^r \vee l_2^r \vee l_3^r)$ in ϕ, introduce a triple of vertices v_1^r, v_2^r, v_3^r in V
- Build an edge between v_i^r, v_j^s if both of the following hold:
  - v_i^r and v_j^s are in different triples, and
  - l_i^r is not the negation of l_j^s

$$\phi = (x_1 \vee \neg x_2 \vee \neg x_3) \wedge (\neg x_1 \vee x_2 \vee x_3) \wedge (x_1 \vee x_2 \vee x_3)$$

$\leq_p$



3-CNF-SAT $\leq_p$ CLIQUE

③ Prove that $x \in$ 3-CNF-SAT $\Leftrightarrow$ $f(x) \in$ CLIQUE

Correctness proof: ϕ with k clauses is satisfiable $\Rightarrow G = f(\phi)$ has a clique of size k

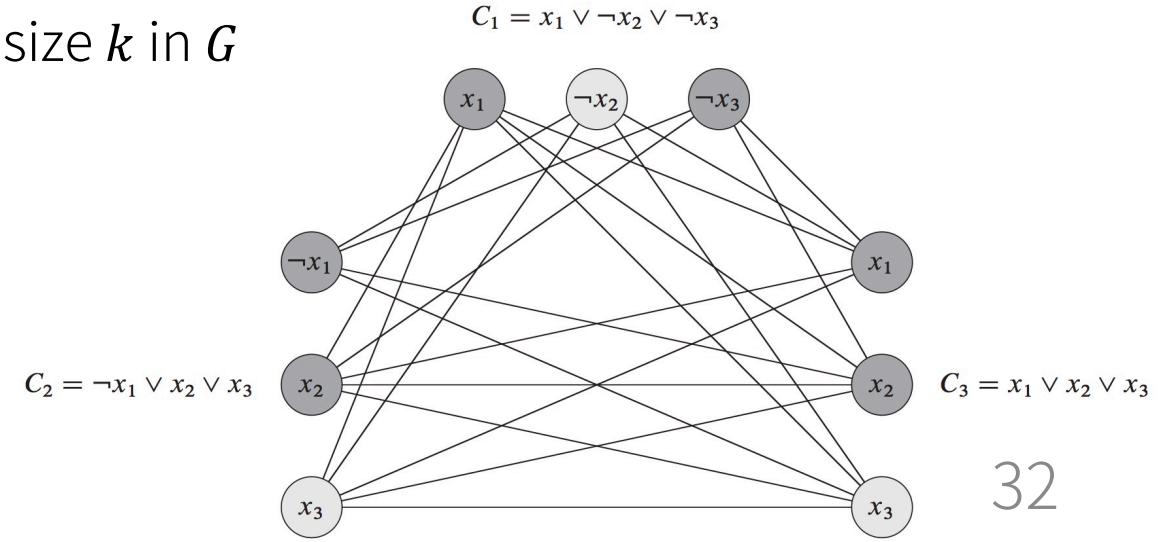
If ϕ is satisfiable,

$\Rightarrow$ Each C_r contains at least one $l_i^r = 1$ and each such literal corresponds to a vertex v_i^r

We select such a literal from each C_r and form a set k literals

$\Rightarrow$ For any two selected literals $l_i^r, l_j^s, r \neq s$ and $l_i^r \neq \neg l_j^s$

$\Rightarrow$ The corresponding vertices form a clique of size k in G



3-CNF-SAT $\leq_p$ CLIQUE

③ Prove that $x \in$ 3-CNF-SAT $\Leftrightarrow f(x) \in$ CLIQUE

Correctness proof (cont'd): $G = f(\phi)$ has a clique of size $k \Rightarrow \phi$ with k clauses is satisfiable

G has a clique V' of size k

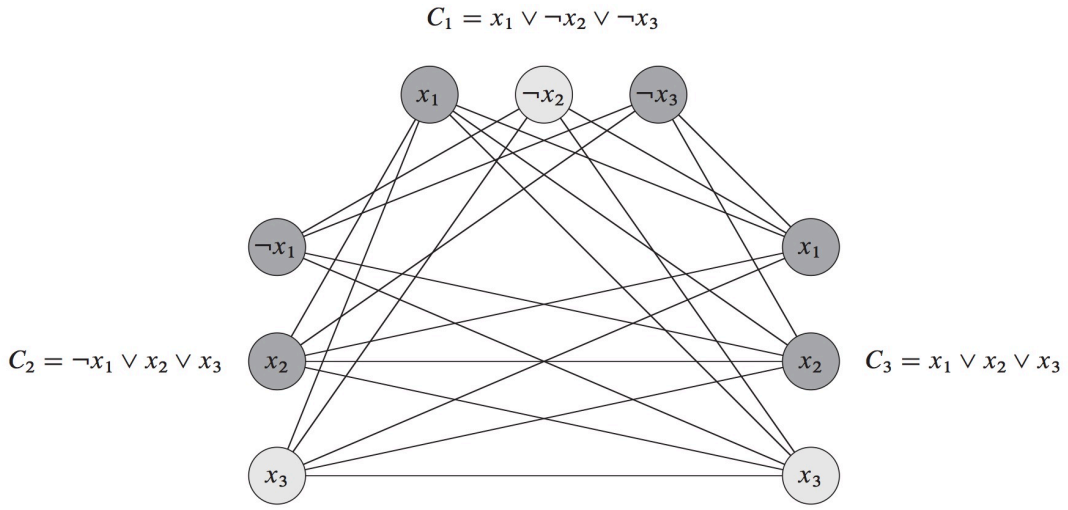
$\Rightarrow$ For all $v_i^r, v_j^s \in V', (v_i^r, v_j^s) \in E$

$\Rightarrow$ For all $v_i^r, v_j^s \in V', l_i^r \neq \neg l_j^s$

$\Rightarrow$ Assigning 1 to each l_i^r where $v_i^r \in V'$ results in a feasible assignment

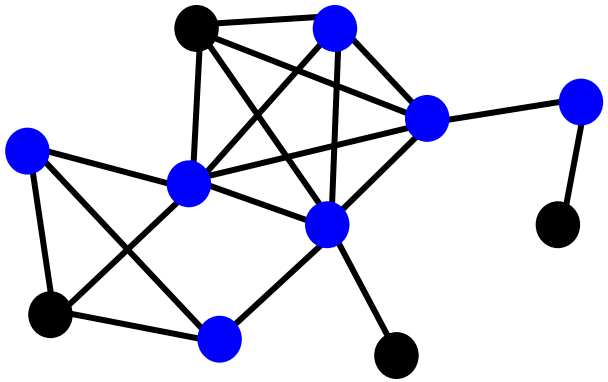
Also, V' must contain exactly one vertex per triple since no edges are within the same triple

$\Rightarrow$ Each C_r is satisfied, and so is ϕ



The vertex-cover problem

- A vertex cover of $G = (V, E)$ is a subset $V' \subseteq V$ such that if $(w, v) \in E$, then $w \in V'$ or $v \in V'$ or both
  - A vertex cover "covers" every edge in G
- Optimization problem: find a vertex cover of minimum size in G
- Decision problem: find a vertex cover of size k in G



Does G have a vertex cover of size 11?

Does G have a vertex cover of size 7?

Does G have a vertex cover of size 6?

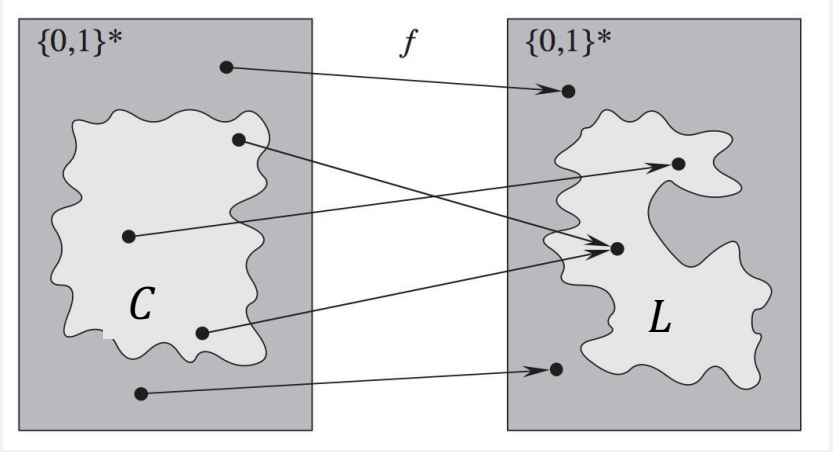
The Vertex-Cover Problem

VERTEX-COVER = $\{\langle G, k\rangle$: graph G has a vertex cover of size $k\}$

- Prove that VERTEX-COVER $\in$ NP-Complete
- Polynomial-time reduction: $\mathbf{CLIQUE} \leq_p$ VERTEX-COVER

Step-by-step approach for proving L in NPC:

1. Prove $L \in$ NP
2. Prove $L \in$ NP-hard ($C \leq_p L$)
   - ① Select a known NPC problem C
   - ② Construct a reduction f transforming every instance of C to an instance of L
   - ③ Prove that x in C if and only if $f(x)$ in L for all x in $\{0,1\}^*$
   - ④ Prove that f is a polynomial time transformation



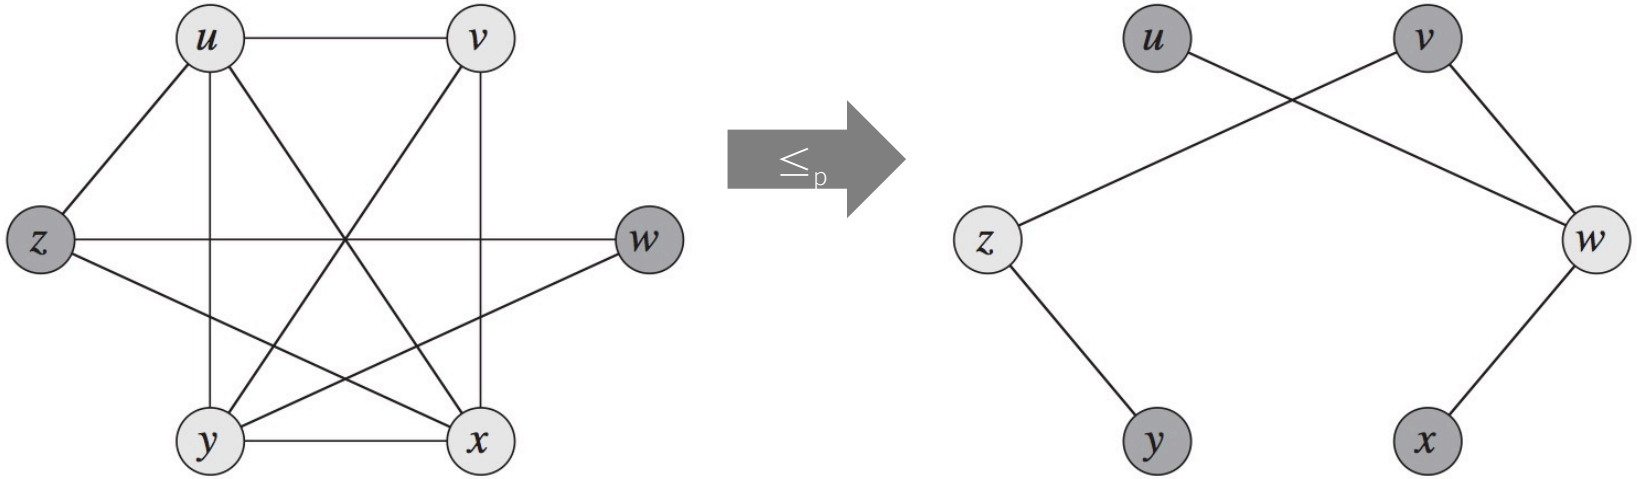
The Vertex-Cover Problem

VERTEX-COVER = $\{\langle G, k\rangle$: graph G has a vertex cover of size $k\}$

② Construct a reduction f transforming every CLIQUE's instance to a VERTEX-COVER instance

- $f(\{G, k\}) = \{G_c, |V| - k\}$
- G_c is the complement of G
  - Given $G = \langle V, E\rangle$, G_c is defined as $\langle V, E_c\rangle$ s.t. $E_c = \{(u, v) | (u, v) \notin E\}$
- We want to prove that G has a clique of size $k \Leftrightarrow G's$ complement (G_c) has a vertex cover of size $|V| - k$

Example: G has a clique of size 4 $\Leftrightarrow$ G_c has a vertex cover of size 2



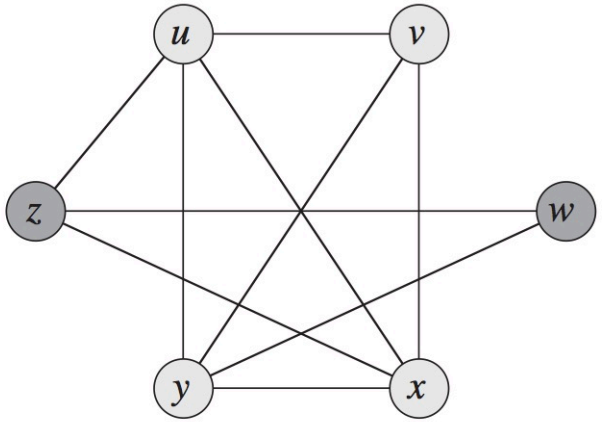
(a) (b)

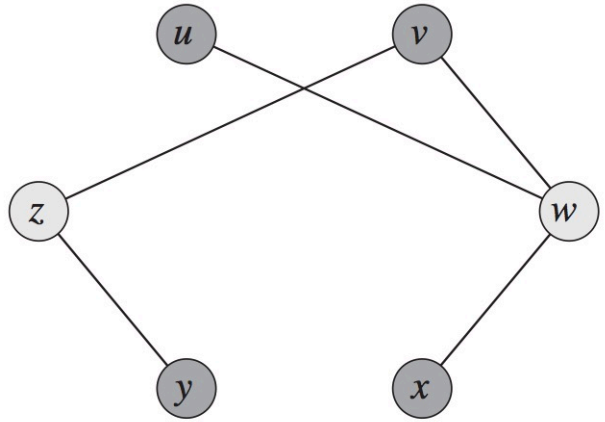
CLIQUE $\leq_p$ VERTEX-COVER

③ Prove that $x \in$ CLIQUE $\Leftrightarrow f(x) \in$ VERTEX-COVER

Correctness proof: G has a clique of size $k \Rightarrow G_c$ has as a vertex cover of size $|V| - k$

- Suppose that G has a clique $V' \subseteq V$ with $|V'| = k$
- $\Rightarrow$ for all $(w, v) \notin E$ (i.e, $\in E_c$), at least one of w or $v \notin V'$
- $\Rightarrow w \in V - V'$ or $v \in V - V'$ (or both)
- $\Rightarrow$ edge (w, v) in G_c is covered by $V - V'$
- $\Rightarrow V - V'$ forms a vertex cover of G_c, and $|V - V'| = |V| - k$



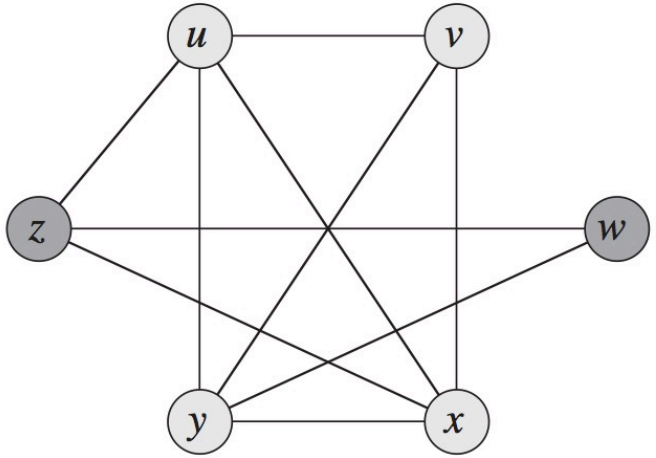


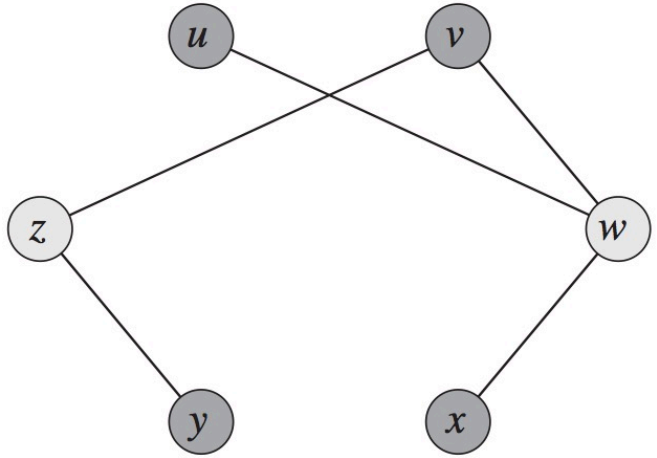
CLIQUE $\leq_p$ VERTEX-COVER

③ Prove that $x \in$ CLIQUE $\Leftrightarrow f(x) \in$ VERTEX-COVER

Correctness proof (cont'd): G_c has as a vertex cover of size $|V| - k \Rightarrow G$ has a clique of size k

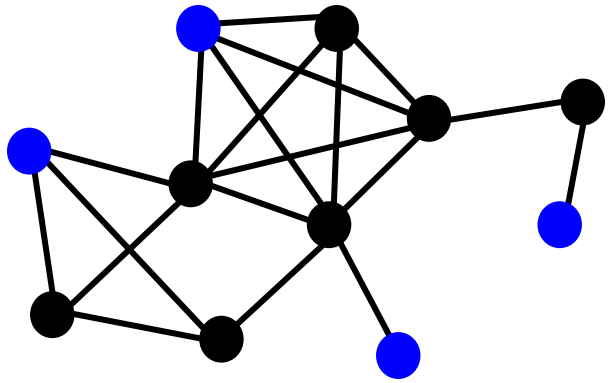
- Suppose G_c has a vertex cover $V' \subseteq V$ with $|V'| = |V| - k$
- $\Rightarrow \forall\, u, v \in V$, if $(u, v) \in E_c$, then $u \in V'$ or $v \in V'$ or both
- $\Rightarrow \forall\, u, v \in V$, if $u \notin V'$ and $v \notin V'$, then $(u, v) \notin E_c$; that is, $(u, v) \in E$
- $\Rightarrow V - V'$ is a clique, and $|V - V'| = k$





The independent-set problem

- An independent set of $G = (V, E)$ is a subset $V' \subseteq V$ such that G has no edge between any pair of vertices in V'
- Optimization problem: find an independent set of maximum size in G
- Decision problem: find an independent set of size k in G



Does G have an independent set of size 1?

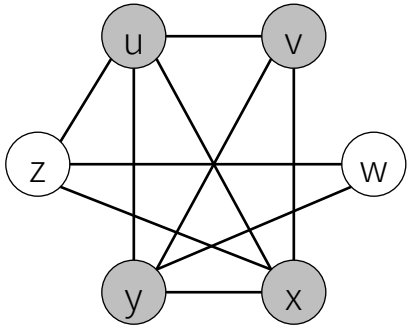
Does G have an independent set of size 4?

Does G have an independent set of size 5?

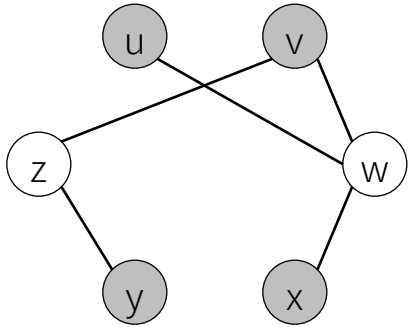
Practice: show that IND-SET is NP-Complete (Textbook Problem 34-1)

Clique, Independent-Set, Vertex-Cover

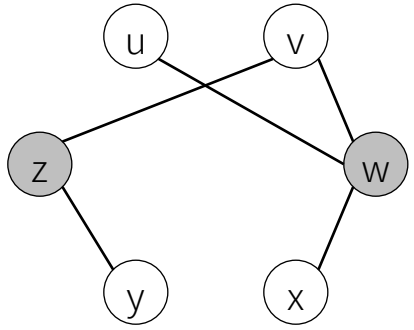
- The following are equivalent for $G = (V, E)$ and a subset V' of V:
  1. V' is a clique of G
  2. V' is an independent set of G_c
  3. $V - V'$ is a vertex cover of G_c



Clique
$V' = \{u, v, x, y\}$ in G



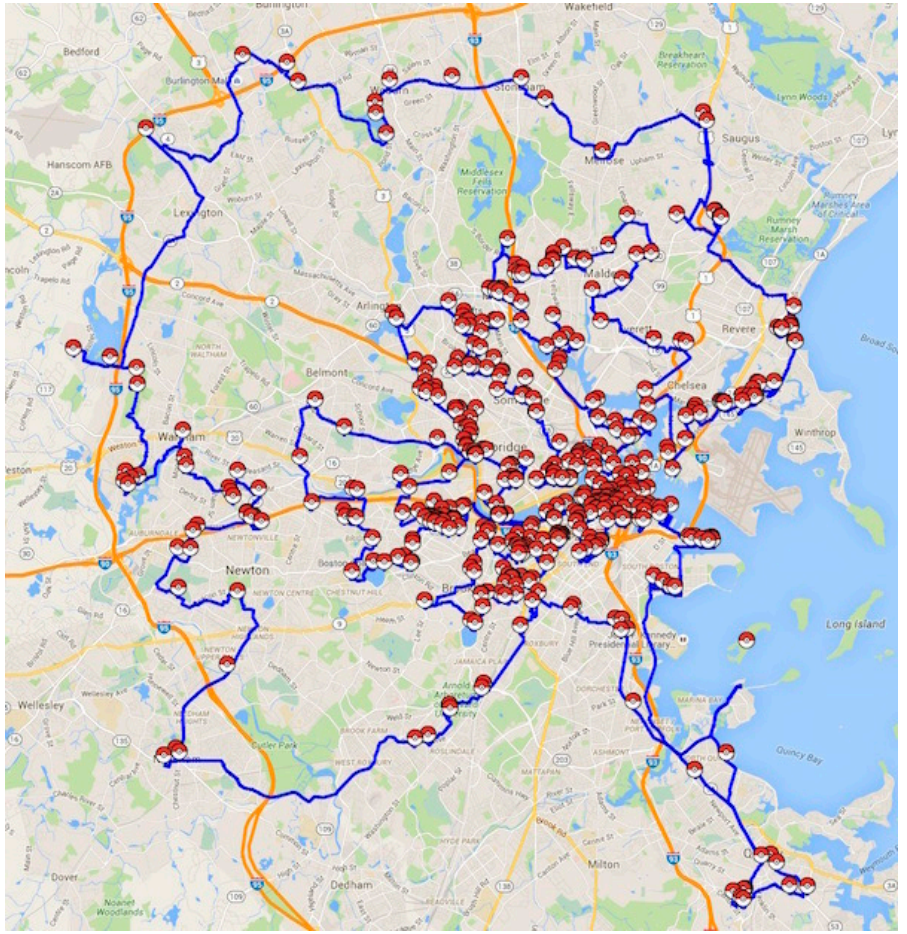
Independent set
$V' = \{u, v, x, y\}$ in G_c



Vertex cover
$V - V' = \{z, w\}$ in G_c

Traveling Salesman Problem (TSP)

- Optimization problem: Given a set of cities and their pairwise distances, find a tour of lowest cost that visits each city exactly once.
- Decision problem: Given a set of cities and their pairwise distances, find a tour of cost at most k that visits each city exactly once.



A tour to catch every (518) Pokémon in Boston
https://www.math.uwaterloo.ca/tsp/poke/index.html

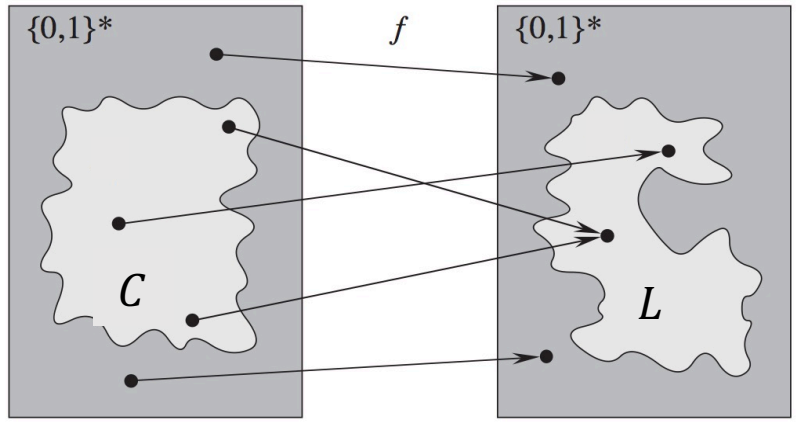
The TSP Problem

$\mathbf{TSP} = \{\langle G, c, k\rangle : G = (V, E)$ is a complete graph, c is a non-negative cost function for edges, G has a traveling-salesman tour with cost at most $k\}$

- Prove that $\mathbf{TSP} \in$ NP-COMPLETE
- Polynomial-time reduction: HAM-CYCLE $\leq_p$ TSP

Step-by-step approach for proving L in NPC:

1. Prove $L \in$ NP
2. Prove $L \in$ NP-hard ($C \leq_p L$)
   ① Select a known NPC problem C
   ② Construct a reduction f transforming every instance of C to an instance of L
   ③ Prove that x in C if and only if $f(x)$ in L for all x in $\{0,1\}^*$
   ④ Prove that f is a polynomial time transformation



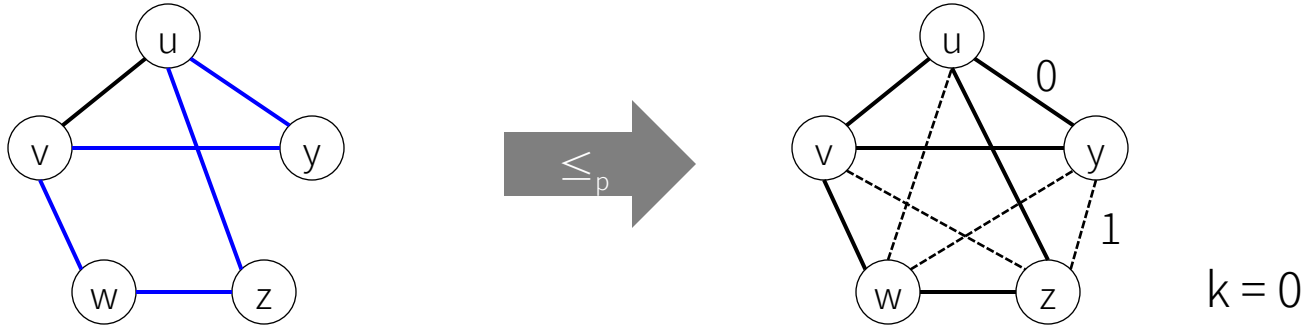
The TSP Problem

$\mathrm{TSP} = \{\langle G, c, k\rangle : G = (V, E)$ is a complete graph, c is a non-negative cost function for edges, G has a traveling-salesman tour with cost at most $k\}$

② Construct a reduction f transforming every HAM-CYCLE's instance to a TSP instance

- Given a HAM-CYCLE instance, we construct a TSP instance in which G is a complete graph and

$$c(i, j) = \begin{cases} 0 & \text{if } (i, j) \in E\ , \\ 1 & \text{if } (i, j) \notin E\ . \end{cases}$$



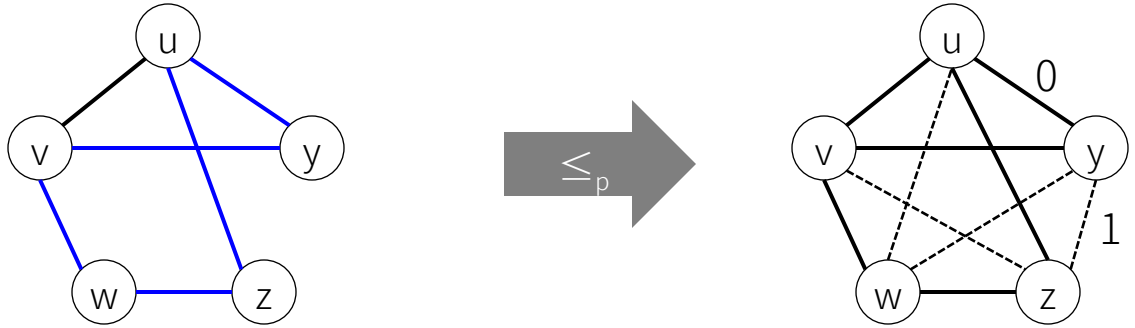
HAM-CYCLE $\leq_p$ TSP

③ Prove that $x \in$ HAM_CYCLE $\Leftrightarrow f(x) \in$ TSP

Correctness proof: $x \in$ HAM-CYCLE $\Leftrightarrow f(x) \in$ TSP

- More specifically, we want to prove that G contains a Hamiltonian cycle $h = \langle v_1, v_2, \ldots, v_n, v_1 \rangle$ if and only if $\langle v_1, v_2, \ldots, v_n, v_1 \rangle$ is a traveling-salesman tour with cost at most 0

u, y, v, w, z, u is a Hamiltonian cycle ⇔ u, y, v, w, z, u is a traveling-salesman tour with cost 0

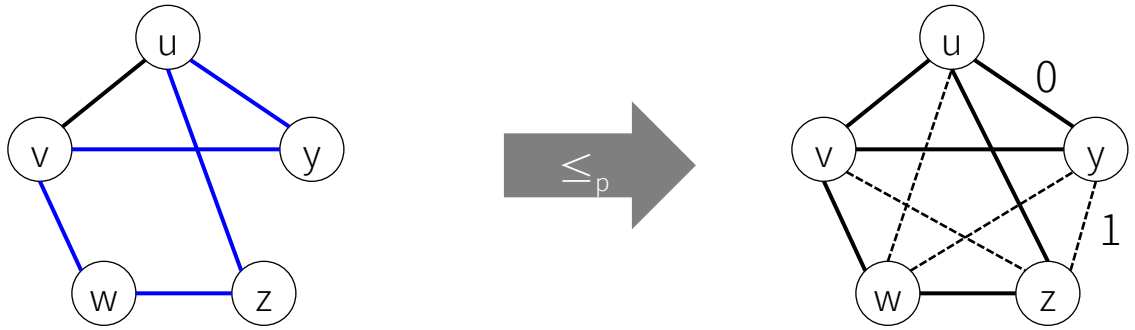


HAM-CYCLE $\leq_p$ TSP

③ Prove that $x \in$ HAM_CYCLE $\Leftrightarrow f(x) \in$ TSP

Correctness proof: $x \in$ HAM-CYCLE $\Rightarrow f(x) \in$ TSP

- Suppose the Hamiltonian cycle is $h = \langle v_1, v_2, \ldots, v_n, v_1 \rangle$
- $\Rightarrow h$ is also a tour in the transformed TSP instance
- $\Rightarrow$ The distance of the tour h is 0 since there are n consecutive edges in E, and so has distance 0 in $f(x)$
- $\Rightarrow f(x) \in$ TSP ($f(x)$ has a TSP tour with cost ≤ 0)



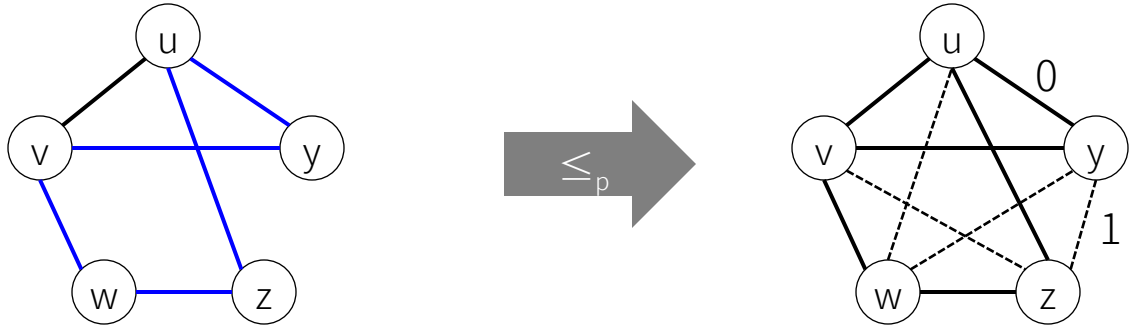
u, y, v, w, z, u is a Hamiltonian cycle

u, y, v, w, z, u is a traveling-salesman tour with cost 0

HAM-CYCLE $\leq_p$ TSP

Correctness proof: $f(x) \in \text{TSP} \Rightarrow x \in \text{HAM}-\text{CYCLE}$

- Suppose after reduction, there is a TSP tour with cost ≤ 0. Let it be $\langle v_1, v_2, \ldots, v_n, v_1 \rangle$
- $\Rightarrow$ The tour contains only edges in E
- $\Rightarrow$ Thus, $\langle v_1, v_2, \ldots, v_n, v_1 \rangle$ is a Hamiltonian cycle ($x \in$ HAM-CYCLE).



u, y, v, w, z, u is a Hamiltonian cycle

u, y, v, w, z, u is a traveling-salesman tour with cost 0

TSP arts and challenges

Shortest possible tour to nearly every (49687) pub in the United Kingdom
https://www.math.uwaterloo.ca/tsp/uk/

To solve or cope with it

Design an algorithm to solve the computational problem efficiently

Prove that the problem is too hard to solve (no easier than solving NP-complete problems!)

… and then
try to cope with it!

Coping with NP-Hard problems

Since polynomial-time solutions are unlikely (unless P = NP), we must sacrifice either optimality, efficiency, or generality

- Approximation algorithms: guarantee to be a fixed ratio away from the optimum
- Randomized algorithms: make use of a randomizer for operation
- Local search: simulated annealing (hill climbing), genetic algorithms, etc.
- Exponential algorithms/Intelligent exhaustive search: feasible when problem size is small
- Pseudo-polynomial time algorithms: e.g., DP for the knapsack problem
- Restriction: work on some special cases of the original problem. e.g., the maximum independent set problem in circle graphs

Advances in algorithms, machine learning, and hardware can help tackle many NP-hard problems once thought impossible.

BY LANCE FORTNOW

Fifty Years of P vs. NP and the Possibility of the Impossible

ON MAY 4, 1971, computer scientist/mathematician Steve Cook introduced the P vs. NP problem to the world in his paper, "The Complexity of Theorem Proving Procedures." More than 50 years later, the world is still trying to solve it. In fact, I addressed the subject 12 years ago in a *Communications* article

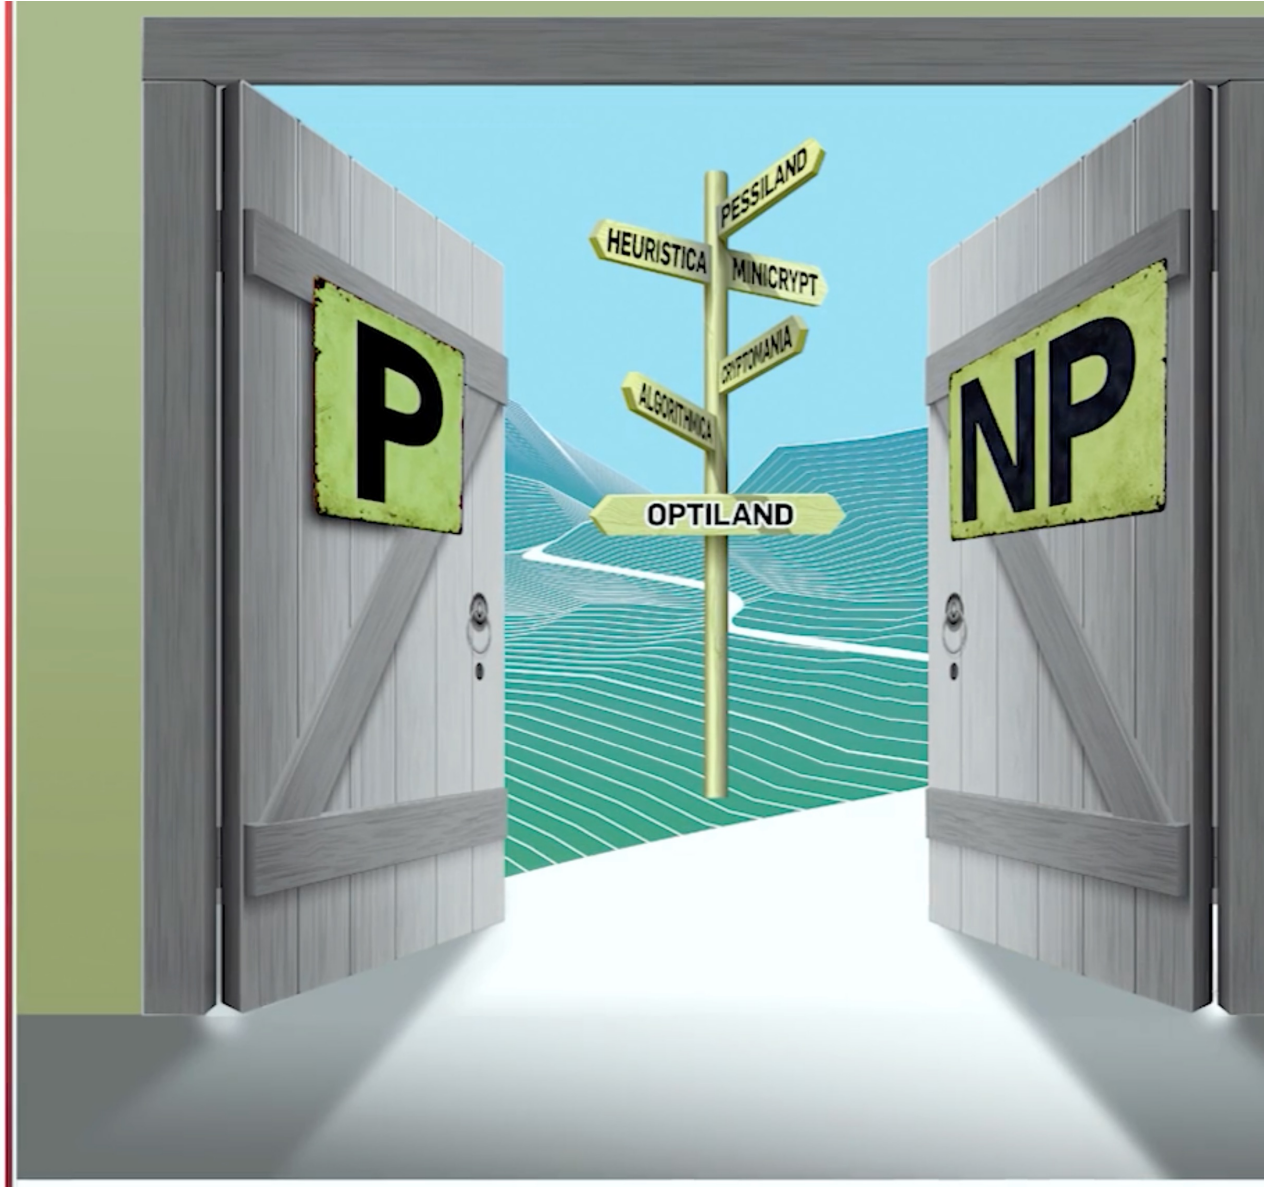
most importantly, the rise of data science and machine learning. In 2009, the top 10 companies by market cap included a single Big Tech company: Microsoft. As of September 2020, the first seven are Apple, Microsoft, Amazon, Alphabet (Google), Alibaba, Facebook, and Tencent.[38] The number of computer science (CS) graduates in the U.S. more than tripled[8] and does not come close to meeting demand.

Rather than simply revise or update the 2009 survey, I have chosen to view advances in computing, optimization, and machine learning through a P vs. NP lens. I look at how these advances bring us closer to a world in which P = NP, the limitations still presented by P vs. NP, and the new opportunities of study which have been created. In particular, I look at how we are heading toward a world I call "Optiland," where we can almost miraculously gain many of the advantages of P = NP while avoiding some of the disadvantages, such as breaking cryptography.

As an open mathematical problem, P vs. NP remains one of the most important; it is listed on the Clay Mathematical Institute's Millennium Problems[21] (the organization offers a million-dollar bounty for the solution). I close the article by describing some new theoretical computer science results that, while not getting us closer to solving the P vs. NP question, show us that thinking

» key insights

- The P vs. NP problem turned 50 in 2021 and its resolution remains far out of reach. Dramatic advances in algorithms and hardware have allowed us to tackle many NP-complete problems



about P vs. NP still drives much of the | groups, but nothing you do seems to | we can efficiently solve the Clique p

Preview: approximation algorithms

What is approximation?

- “A value or quantity that is nearly but not exactly correct”
- Approximation algorithms
  - applied to optimization problem, not decision problems
  - should guaranteed to find solutions close to optimality, returning near-optimal answers
    - Cf. heuristics search: no guarantee
    - How “near” is near-optimal?

Approximation algorithms

- $\rho(n)$ -approximation algorithm
  - Efficient: guaranteed to run in polynomial time
  - General: guaranteed to solve every instance of the problem
  - Near-optimal: guaranteed to find solution within a factor of $\rho(n)$ of the cost of an optimal solution
- Approximation ratio $\rho(n)$
  - n: input size
  - C^*: cost of an optimal solution
  - C: cost of the solution produced by the approximation algorithm

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n)$$

Maximization problem: $\frac{C^*}{C} \leq \rho(n)$

Minimization problem: $\frac{C}{C^*} \leq \rho(n)$

Approximate ratio ρ(n)

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n)$$

n: input size
C^*: cost of optimal solution
C: cost of approximate solution

- $\rho(n) \geq 1$
- $\rho(n)$ 越小越好！
- An exact algorithm has $\rho(n) = 1$

- Challenge: prove that C is close to C^* without knowing C^*!

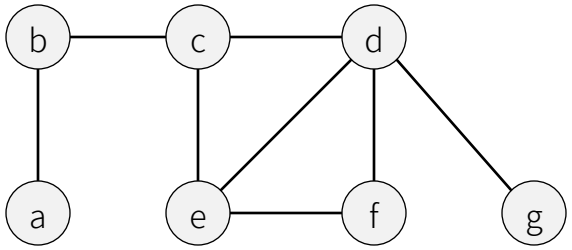
Approximate Vertex-Cover

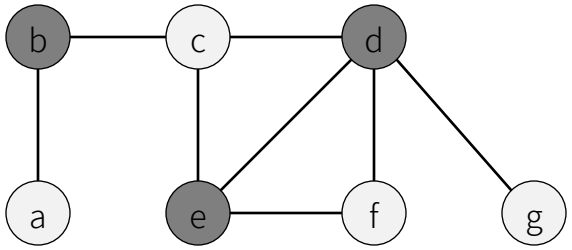
Vertex Cover

A vertex cover of $G = (V, E)$ is a subset $V' \subseteq V$ such that if $(w, v) \in E$, then $w \in V'$ or $v \in V'$ or both

The Vertex-Cover Problem (Optimization)

Find a vertex cover of minimum size in G

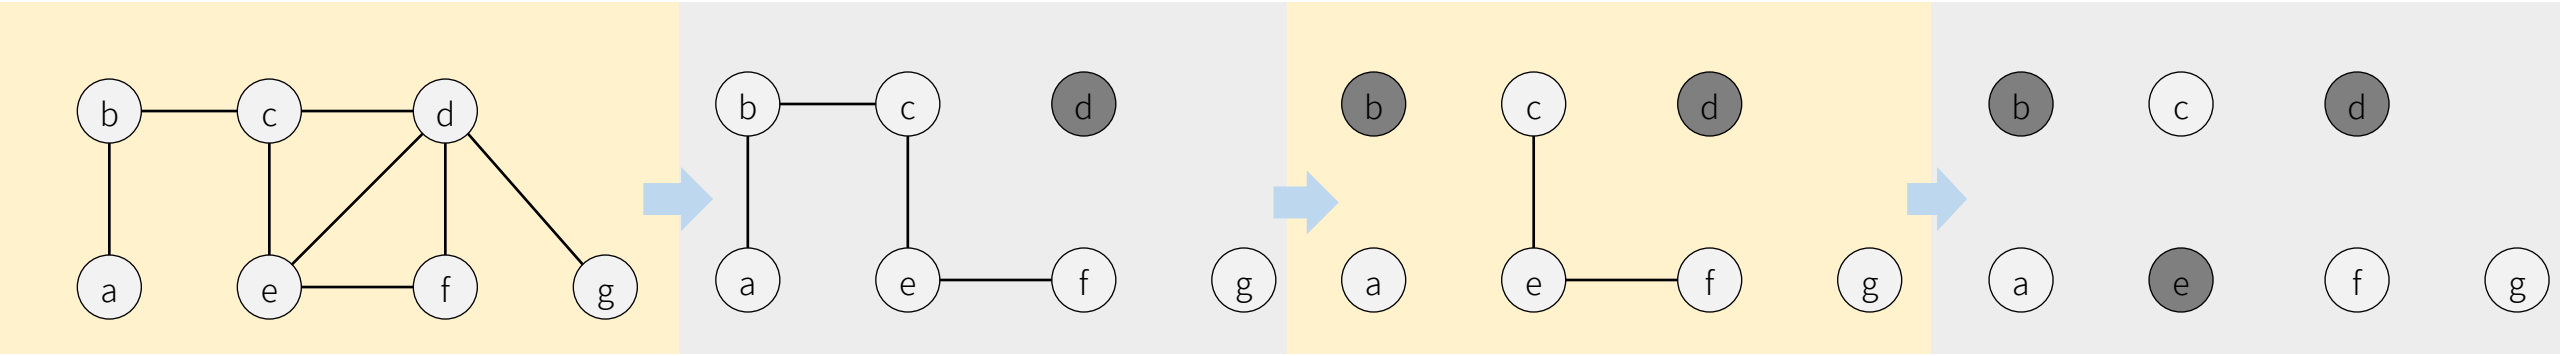




b, d, e is a minimum vertex cover (size = 3)

Q: Consider a greedy heuristic: In each iteration, cover as many edges as possible (vertex with the maximum degree) and then delete the covered edges. Does it always find an optimal solution?

- No. Otherwise, we would have proven N=NP.



b, d, e is a vertex cover of size 3 found by the greedy algorithm (and it happens to be optimal!)

Q: Construct a graph on which the above greedy heuristic does not yield an optimal solution

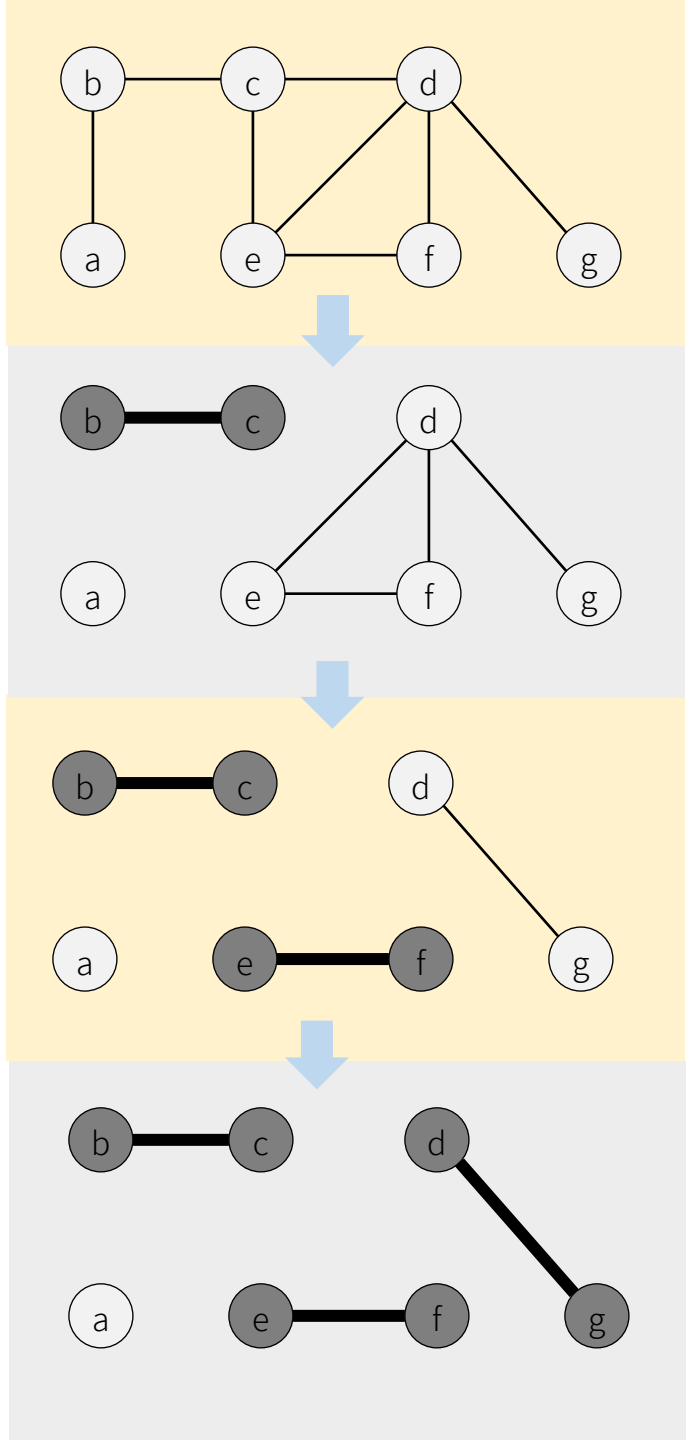
Exercise 35.1-3 Construct a graph on which the above greedy heuristic does not have an approximation ratio of 2.

An approximation algorithm to VERTEX-COVER

- APPROX-VERTEX-COVER
  - Randomly select one edge at a time
  - Add both vertices to the cover
  - Remove all incident edges
- Running time = $O(V + E)$
- Claim: Approximation ratio $\rho(n) = 2$

```
APPROX-VERTEX-COVER(G)
1  C = ∅
2  E' = G.E
3  while E' ≠ ∅
4      let (u, v) be an arbitrary edge of E'
5      C = C ∪ {u, v}
6      remove from E' every edge incident on either u or v
7  return C
```

An approximation algorithm to VERTEX-COVER: example



b, c, d, e, f, g is a vertex cover of size 6 found by the approximation algorithm (not optimal!)

APPROX-VERTEX-COVER is 2-approximation

Let A denote the set of edges picked in line 4.
$\Rightarrow$ size of the vertex cover $|S| = 2|A|$

In any vertex cover S' (including S^*), every vertex v in S' covers at most one edge in A because no two edges in A share a vertex.

$\Rightarrow |A| \leq |S^*|$

Combing the two equations, we have
$\frac{1}{2}|S| = |A| \leq |S^*|$

$\Rightarrow \rho(n) = 2$

Note: the proof doesn't require knowing the actual value of $|S^*|$
